

MASTER ABRASIVES

New grinding machine installed in the Master showroom

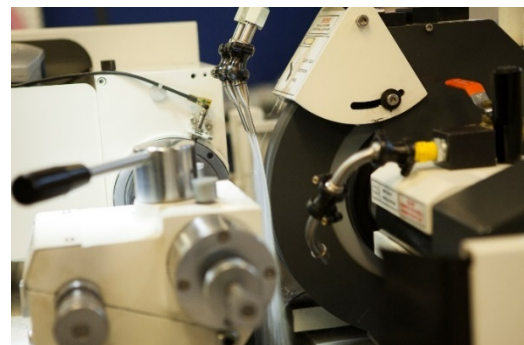

Master Abrasives has been busy setting up a new showroom at its Daventry location for demonstrating precision grinding products including abrasives, dressers, and Micromatic grinding machines. Following the recent visit of an installation engineer from Micromatic Grinding Technologies, the eco 200 universal hydraulic cylindrical grinding machine is now installed and ready for demonstration in the Master showroom.

Martin Stevens, Technical Sales Representative for grinding machines and precision products, says "Having the eco 200 installed at our showroom facility will be a great aid in showing customers the capabilities of Micromatic machines. Demonstrations of the eco 200 can be arranged on request and we already have many interested customers who have scheduled their visit to see the machine."

The high-performance brand of MASTER® grinding wheels and dressers will be available to use in demonstration of the eco 200 to provide efficient grinding and surface finishing. The showroom machine is set up with a coolant application nozzle system by Cool-Grind Technologies, providing accurate coolant flow and pressure to the process. This gives visitors the opportunity to see Grind-Loc nozzles in action and understand how they can help to achieve optimum performance from grinding processes.

Q8Oils has worked with Master Abrasives to supply the suitable oils and cutting fluid for the eco 200 U demonstration machine. The team of technical experts has provided products to improve the operational efficiency and optimise the production process.

The combination of Master grinding wheels, Cool-Grind nozzles, and Q8Oils on the Micromatic eco 200 machine contributes to achieving optimum grinding performance in application
